Variety Plots Update:

With the adequate rainfall we've received across our trade territory over the past two weeks, a few growers have had to rip up and replant some of our variety plots. Due to this, our number of variety plots planted will be a little lower than anticipated. Overall, we should still have a good representation of what these varieties are capable of doing across our territory.

Stay tuned for the next issue of *Assess the Progress* to view how these variety plots are progressing, and which ones are already in the reproductive growth stages!

If you would like more information on a plot or trial, please contact your Sunrise Agronomy Solutions Advisor.

Dial in on the Trial:

Our focus trial product this week is **StandUp™ Fertilizer™** on soybeans. Fertilizer not only makes the nutrients in your starter more available, but it makes the nutrients in your soil more available as well. Soil extraction studies have shown up to a 36% increase in the amount of available phosphorus when Fertilizer is applied with a starter fertilizer combination. Enhanced nutrient availability increases early growth, overall plant health, and ultimately yield.

This particular trial is comparing 2 quarts/acre of Fertilizer with 1 pint/acre of **BioBuild™ BioComplete**, compared to no treatment. The plants in the pictures on the right side are treated. This demonstrates increases in early growth by having a much thicker, dense canopy, compared to the plants with no treatments. Overall plant height is greater in the treated areas as well as being further developed in terms of growth stage as well.
